

Desktop Client with Outlook Integration

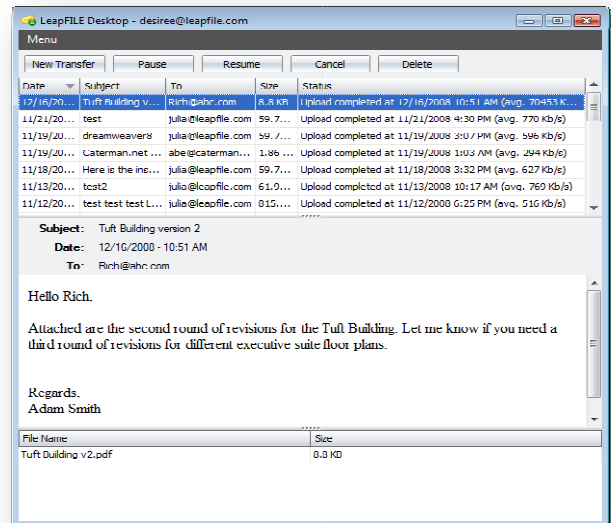

Streamline Your Workflow – Directly Send Files from your Desktop

LeapFILE's Desktop Client provides convenient ways for you to send your business-critical files through the most widely-used applications such as Microsoft Office and Outlook. With the Desktop Client, you now have even greater flexibility and control when exchanging documents as part of your day-to-day business process. You can send your files securely with whoever you want, when you want, and however way you want.

LeapFILE's Desktop Client features seamless integration with Microsoft Outlook and Office, enabling you to securely send files directly from the way you work. With Outlook Integration, you can simply compose an email and attach the files to send through LeapFILE's secure platform. Additional features such as "Right-Click" to Send, Command Line Scripting, Microsoft Office Integration and Thunderbird Add-ons are also available as part of LeapFILE's Desktop Client....all of which help you streamline your workflow and make your file transfer process as easy and as convenient as it can be.

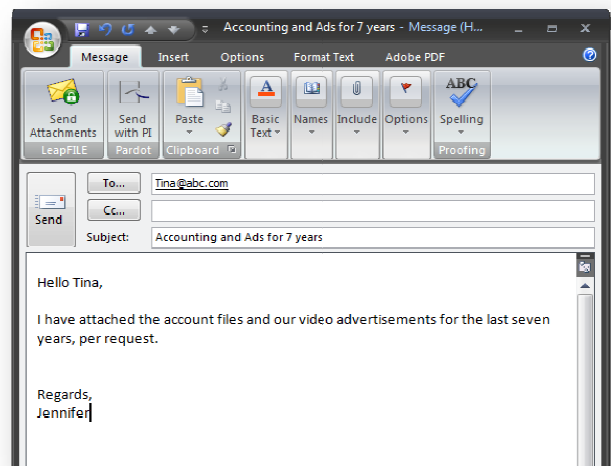

Desktop Client

LeapFILE's Desktop Client employs a user friendly interface which lets you send files directly from your desktop by simply dragging and dropping the files and folders into the application without the need to open a web browser. The pause and resume options provide automatic recovery, giving you the flexibility you need for your busy schedule. You can also easily send files by "right-clicking" on the file. With the Desktop Client, you are able to send files of any size without limitations that are otherwise imposed by web browsers, which is typically a maximum of 2GB.

Seamless Integration with MS Outlook & Mozilla Thunderbird

The Desktop Client contains add-ons for MS Outlook and Mozilla Thunderbird which enables you to easily email all file attachments securely through LeapFILE's platform, while allowing you to continue communicating with your clients, partners, and team members the way you are used to. There is no need to reconfigure your email servers because it is a client-side solution via an Outlook plug-in or Thunderbird add-on that is easily deployed. User configuration controls such as file size threshold levels, domain exclusion, and archiving options give you even greater control over your files sent through Outlook or

Thunderbird. Large file attachments are automatically detected and sent via LeapFILE - thus you avoid the pain of having to periodically delete emails to keep your email box size within size limits. From an email administrator's point of view, letting LeapFILE handle your users' large file attachments reduces the burden that otherwise would have bogged down your email server.

Features Overview

End-to-end Encryption	<input checked="" type="checkbox"/>
Send Files of any size and type	<input checked="" type="checkbox"/>
Delivery Notifications	<input checked="" type="checkbox"/>
MS Outlook Plug-in	<input checked="" type="checkbox"/>

Mozilla Thunderbird Add-on	<input checked="" type="checkbox"/>
Right-Click to Send	<input checked="" type="checkbox"/>
Pause & Resume Transfers	<input checked="" type="checkbox"/>
Command Line Scripting	<input checked="" type="checkbox"/>
Configuration Options	<input checked="" type="checkbox"/>

MS Office Integration

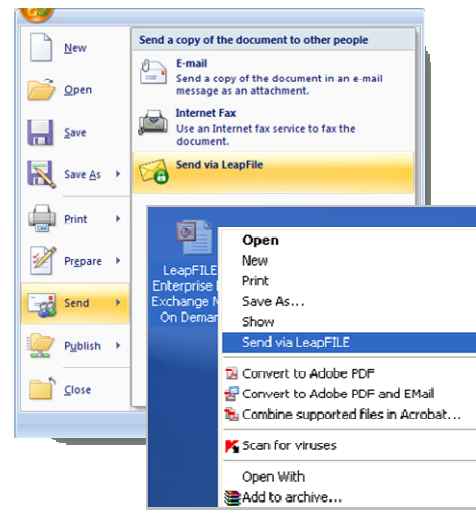

Send your Microsoft Office files such as PowerPoint presentations or Excel spreadsheets directly from the applications without having to open your email client or web browser. All of the transfers would include encryption, pause and resume options and tracking capabilities.

Command Line Scripting

With the Desktop Client, you have the ability to write scripts, which allows users to simplify the process for repeated transfers by setting up automation rules. Command Line Scripting provide users with even greater flexibility and control of their file transfers and reporting features.

IT Management Control

IT Administrators have the ability to adjust settings for users throughout their entire account. Through LeapFILE's Desktop Client Management console, IT administrators can control configuration options such as proxy server settings and automatic update options. IT administrators also have control over the file attachment threshold level and the domain exclusion option for Outlook users. This provides centralized management for IT administrators to easily manage all account settings. Additionally, all transfers are recorded to provide a clear audit trail for reporting purposes.
